DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Diamantopoulos et al. US Patent No. 4,930,504 in view of Neuberger US Patent No. 5,771,325.

Diamantopoulos et al. discloses a phototherapeutic apparatus comprising: light delivery probe(s); a plurality of radiation sources; multiple radiation output ports; and means for controlling power output levels of the radiation emitted through each radiation output port as claimed with the exception of light delivery optical fiber(s) disposed between the radiation sources and output ports. The light sources are disposed proximate the distal end of the delivery probe(s). Hence, Diamantopoulos et al. eliminate the need for using waveguides to conduct optical energy from the sources to the output ports.

However, the use of optical fibers disposed between a light source and an output port to transmit optical energy from light source to a treatment site is known in the art. Neuberger discloses an alternative light delivery apparatus comprising plurality of optical fibers disposed between multiple light sources and light output ports for

transmitting optical energy from the light sources to the output delivery ports. Therefore, at the time of the applicant's invention, it would have been obvious to one skilled in the art to dispose optical waveguide(s) to between separate light source(s) and light output ports as an equivalent alternative means to transmit optical energy.
